# Filtering

Method	Description
Where	Filter values by a predicate function (where)
OfType	Filter values based on their ability to be coerced to a type (can use on IEnumerable)

# Set Operations

Method	Description
Distinct	Remove duplicate values
Except	Returns the differences
Intersect	Returns the intersection
Union	Returns unique elements

# Summary

```
var query2 =  
    cars.GroupBy(c => c.Manufacturer)  
        .Select(g =>  
            {  
                var results = g.Aggregate(new CarStatistics(),  
                    (acc, c) => acc.Accumulate(c),  
                    acc => acc.Compute());  
  
                return new  
                {  
                    Name = g.Key,  
                    Avg = results.Average,  
                    Min = results.Min,  
                    Max = results.Max  
                };  
            })  
        .OrderByDescending(r => r.Max);
```
